Motivation

Cynical view:

$$\text{Policy Analysis} = \text{Research} - \text{Novelty} - \text{Rigor}$$

Motivation

Cynical view:

$$\text{Policy Analysis} = \text{Research} - \text{Novelty} - \text{Rigor}$$

Optimists view:

$$\text{Policy Analysis} = \text{Research} - \text{Novelty} + \text{Relevance} - \text{Rigor}$$

Motivation

Cynical view:

$$\text{Policy Analysis} = \text{Research} - \text{Novelty} - \text{Rigor}$$

Optimists view:

$$\text{Policy Analysis} = \text{Research} - \text{Novelty} + \text{Relevance} - \text{Rigor}$$

Our proposal:

$$\text{Open Policy Analysis} = \text{Research} - \text{Novelty} + \text{Relevance}$$

Why We Need Open Policy Analysis

Policy Analysis And The Evidence-Based Policy Movement

Evidence-Based movement is growing.

- “The golden age of evidence-based policy” (Haskins 2017).
- Credible causal evidence (Angrist & Pischke, 2010)
- Transparency and reproducibility of research (Miguel et al. 2014).
- Commission on Evidence-Based Policymaking (CEBP, 2017)

Policy Analysis is a fundamental link.

- As many definitions as textbooks (Dunn, 2015; Weimer & Vining, 2017; Williams, 1971)
- Common denominator: client-oriented empirical analysis meant to inform a specific policy debate
- Aspires at scientific rigor. (Wildavsky 1979),

Policy Analysis And The Evidence-Based Policy Movement

- Credible causal evidence (Angrist & Pischke, 2010)
- Transparency and reproducibility of research (Miguel et al. 2014).
- Commission on Evidence-Based Policymaking (CEBP, 2017)

Policy Analysis is a fundamental link.

- As many definitions as textbooks (Dunn, 2015; Weimer & Vining, 2017; Williams, 1971)
- Common denominator: client-oriented empirical analysis meant to inform a specific policy debate
- Aspires at scientific rigor. (Wildavsky 1979),

One Ideal Evidence-Based Policy Link

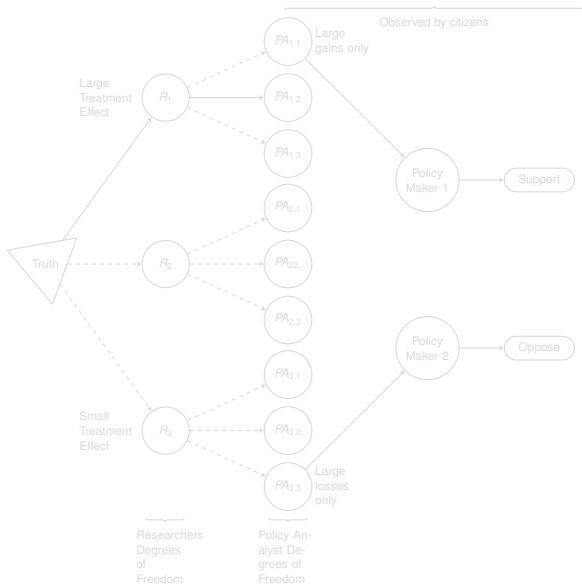

Reproducibility Crisis In Empirical Research

- Large magnitude of publication bias (Franco et al 2014).
- Evidence of extensive p-hacking across social science disciplines (Gerber et al 2008, Brodeur et al 2016).
- Replication rates are low (Collaboration et al, 2015 , Camerer et al, 2016).
- Computational reproducibility is also low (Stodden et al 2016, Chang and Li 2015, Gertler et al 2018).

Credibility Crisis Of Policy Analysis

- Incredible Certitudes (Manski, 2013)
- Report wars (Wesselink et al, 2013)

How This Affects The Evidence Based Policy Link?

How This Affects The Evidence Based Policy Link?

	Empirical Research	Policy Analysis

Solutions		

	Empirical Research	Policy Analysis
Problems	Reproducibility Crisis	Credibility Crisis
Solutions	<i>Open Science</i> Principles, Guidelines, Applications	

The Open Science Movement

- Definition of principles of Open Science/Research Transparency (Miguel et al 2014)
- Development of guidelines to operationalize principles of Open Science (Nosek et al 2015)
- Journals and funders: Journals (Science + 5k other journals), Registries (AEA), Funders (NIH, NSF and multiple donors)

Relevance

Main consequences of policy analysis that lacks openness:

- 1 Cherry picking evidence.
- 2 Challenging to automate and Improve systematically recurring reports.
- 3 Difficulty understanding how research informs policy analysis.

Cherry Picking Evidence

“When I was director of the CBO, I was very frustrated when we would write a policy report [saying] a certain policy would have these two advantages and these two disadvantages, and the advocates would quote only the part about the advantages, and the opponents would quote only the part about the disadvantages. That encourages the view that there are simple answers. There aren’t generally simple answers. There are trade-offs.”

— Douglas Elmendorf (Director of CBO, 2009-2015)
Harvard Magazine, 2016

Cherry Picking Evidence

“When I was director of the CBO, I was very frustrated when we would write a policy report [saying] a certain policy would have these two advantages and these two disadvantages, and the advocates would quote only the part about the advantages, and the opponents would quote only the part about the disadvantages. The Process of Policy Analysis

Principles for Open Policy Analysis

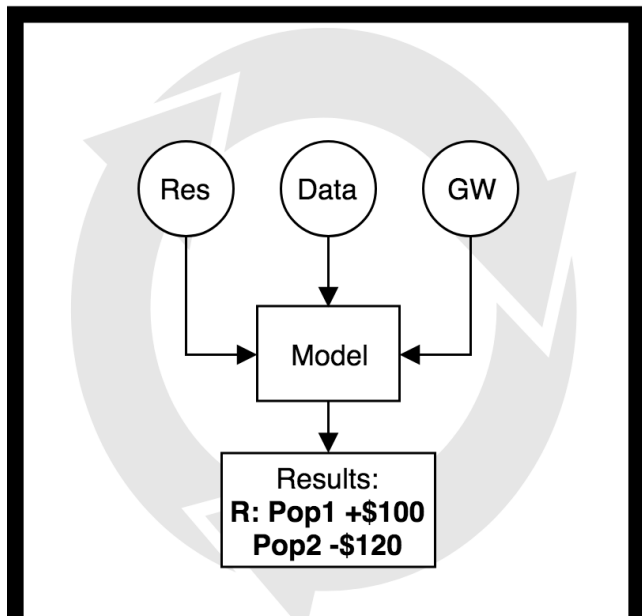

Proposed principles:

- 1 Computational Reproducibility
- 2 Analytic Transparency
- 3 Output Transparency

Principle 1

Computational Reproducibility

- Literate Programming
- Version control
- File structure
- Label sources

Principle 2

Analytic Transparency

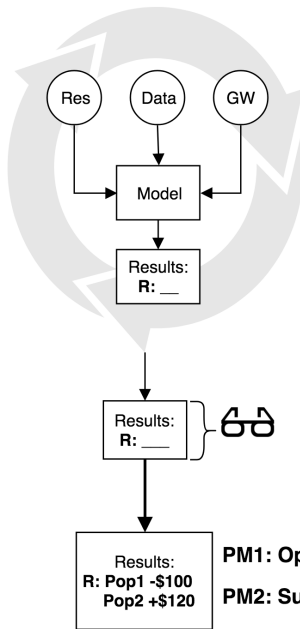

- Open code
- Open data
- Report as Dynamic Document

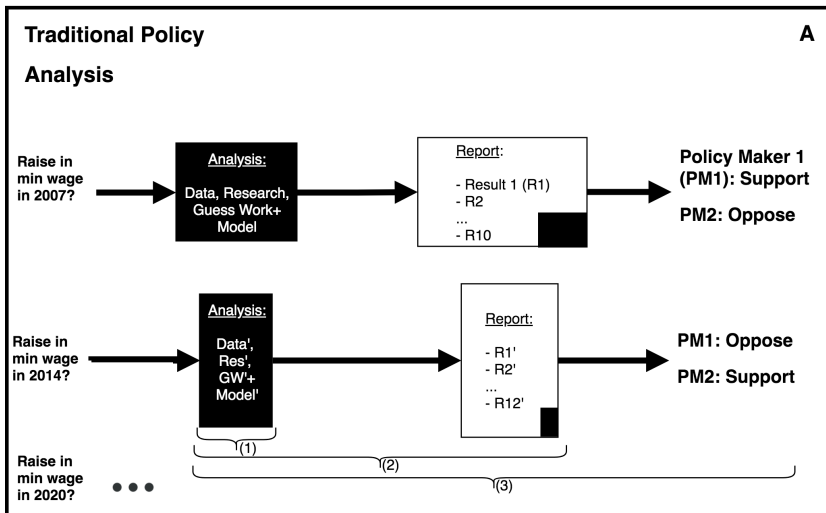

Principle 3

Output Transparency

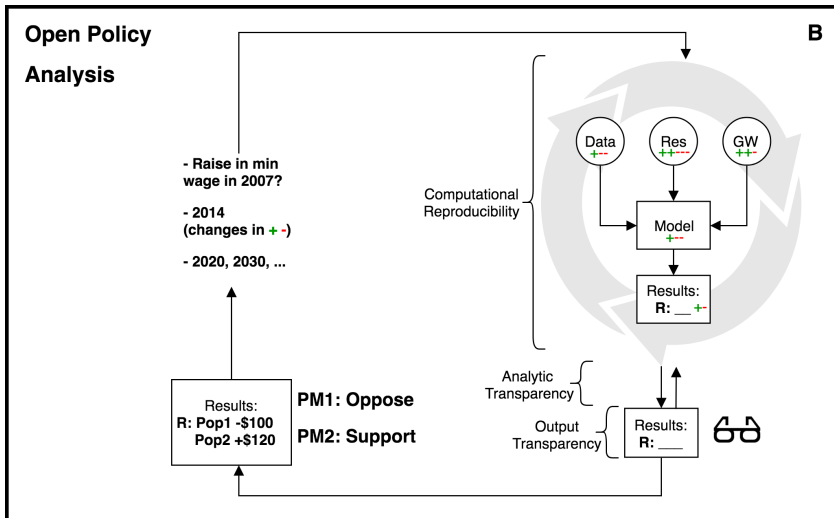

- Pre-committed output display
- Assumptions-output link

Solutions	<i>Open Science</i> Principles, Guidelines, Applications	<i>Open Policy Analysis</i> Principles, Guidelines, Applications

Description of Case Study

“The Effects of a Minimum-Wage Increase on Employment and Family Income” Congressional Budget Office (2014)

Description: CBO estimated the effects of a raise in the federal minimum wage from \$7.25/hr to \$10.10/hr.

Main policy estimates:

- 500,000 jobs would be lost.
- 16.5 million workers would receive a salary increase.
- Distributional effects: below poverty line (PL) +\$5billion; between one and three PL +\$12billion; between three and six PL +\$2billion; above six PL -\$17billion

Key research estimate: Elasticity of labor demand for teenagers in the labor force.

Summary of Adapted Guidelines

Standard Level 0		Level 1	Level 2	Level 3
Workflow	Policy estimates vaguely described	All the inputs, and their corresponding sources, used in the calculations are listed	Lvl 1 + Policy estimates are listed, in same unit if possible	Lvl 2 + all the components can be modified with little effort
Data	Report says nothing	Clearly stated whether all, some components, or none of the data is available, with instructions for access when possible.	Lvl 1 + report and data are in same place	Lvl 2 + Report has specific lines of code that call the data and changes in the data produce traceable changes in the report
Methods & Code	Key assumption are listed	Methods are described in prose. Large amount of work is required to reproduce qualitatively similar estimates	Methods and described in prose, with detailed formulas, and code is provided as supplementary material	Lvl 2 + All is in the same document where changes in the code affect the output automatically

From TOP guidelines (Nosek et al 2015) v1.0.1 ●

	(5%, 35%, 60%)	-17%		-9%	
	$1/N$	-129%		-73%	

Limitations

- There is additional scope for reproducibility.
- Complete case study requires extensive institutional knowledge.
- Guidelines need to be build based on consensus of practitioners.

Discussion

Let's assume this becomes the new status quo.

- Costs of producing the next report on effects of minimum wage will be very small.
- Every additional effort will imply improvements on the “state of the art” report (e. g. $dB L$; $\eta(MW)$, $\alpha_1(MW)$)
- Learning about one parameter (QALYs, DWL) will update estimates *across* reports.
- Much easier to have a substantive and normative policy debate.
Pilot example: [Shiny App!](#).

BITSS/CEGA's next step to push OPA forward

- Partner with key policy analysts to build more case studies (CBO, Tax policy/Inequality, Chilean pension reform)
- Guidelines and trainings
- Developing a new model for collaboration among policy analysts, policy-makers and researchers, with the aim of fostering more direct impact on high-level government decisions

Your next steps to push OPA forward

- Collaborate with BITSS to open up your PA.
- Fund OPA: directly or conditionally.
- Present/showcase your OPA.
- Nominate PA to be open.

Easier Methodological Appraisal. Example: dis-employment effects **Before**

Steps taken to verify the analysis & employment variation ($\widehat{\Delta E} \times 1000$) at each line¹

- ① Find an elasticity: -0.1 (page 25): $\widehat{\Delta E} \approx 300$
- ② What about adults? $\eta^{adults} = \frac{1}{3}\eta^{teens}$ (page 28): $\widehat{\Delta E} \approx 100$
- ③ What about the adjustment? $\widetilde{\eta_{w \leq MW}^g} = \frac{\eta_{lit}^g}{P_{w \leq MW}^g} \times \frac{\% \Delta MW}{\% \Delta w^g}$ (page 26-28 + 2 papers): $\widehat{\Delta E} \approx 1,100$
- ④ The adjustment factors $\frac{1}{P_{w \leq MW}^g} \times \frac{\% \Delta MW}{\% \Delta w^g} = F_{adj}^g$ are not computed from the data (3.2 teens, 19.5 adults). Instead:
 $F_{adj}^{teen} = F_{adj}^{adult} = 4.5$ (page 28) $\widehat{\Delta E} \approx 500$

Steps 2-4 took several days of work! •

¹ Assuming target population ≈ 22 million, $\overline{\Delta w_{w \leq MW'}} \approx 14\%$, and non-compliance $\approx 15\%$

Easier Methodological Appraisal. Example: dis-employment effects **Before**

Steps 2-4 took several days of work! •

¹ Assuming target population ≈ 22 million, $\overline{\Delta w_{w \leq MW'}} \approx 14\%$, and non-compliance $\approx 15\%$

•Equations from Model in DD

$$\widehat{\Delta E} = N \times \eta \times \% \Delta w + \text{Other factors} \quad (1)$$

$$\widehat{N_{final}^s} = g_N(\hat{t}'|t) \times \hat{N}_t^s \times P(\hat{w}' \leq MW^{new}|s) \times (1 - \hat{\alpha}_1^s - \hat{\alpha}_2^s) \quad s = \{\text{teens}\} \quad (2)$$

The elasticity for adults from the literature is define as the one for teenagers with an extrapolation factor.

$$\eta_{lit}^{adults} = \eta_{lit}^{teens} \times F_{extrapolation} \quad (3)$$

• Adjustments to the elasticity of labor demand

Following Neumark and Wascher (2008), Brown (1999). First:

$$\eta_{lit}^s = p_{w \leq MW}^s \eta_{w \leq MW}^s + (1 - p_{w \leq MW}^s) \eta_{w > MW}^s \quad s = \{teens, adults\}$$

Second, assume $\eta_{w \leq MW}^s = 0$:

$$\eta_{w \leq MW}^s = \frac{\eta_{lit}^s}{p_{w \leq MW}^s} \quad s = \{teens, adults\}$$

And third, adjust for the effective average wage variation for each group ($\% \Delta w^s$):

$$\widetilde{\eta_{w \leq MW}^s} = \frac{\eta_{lit}^s}{p_{w \leq MW}^s} \times \frac{\% \Delta MW}{\% \Delta w^s} = \eta_{lit}^s \times F_{ads}^s \quad s = \{teens, adults\}$$

(4)

•Final Effect on Employment

$$\widehat{\Delta E} = \sum_{g \in \{A, T\}} \left(\widehat{N}_g^{final} \times \widetilde{\eta_{w \leq MW}^g} \times \overline{\% \Delta w^g} \right) - \widehat{OF} \quad (5)$$

•Effect on Wages

$$w'' = \begin{cases} w' & \text{if } w \in U[0, 1] < \alpha_1 \\ w^{new} & o/w \end{cases} \quad (6)$$

$$w^{new} = \begin{cases} w'/2 & \text{if } w \in U[0, 1] < \alpha_{aux} \\ \widetilde{w^{new}} & o/w \end{cases} \quad (7)$$

Ripple Effects

$$\widetilde{w^{new}} = \begin{cases} MW' & \text{if } w' < R_{lb} \\ MW' + R^l(w' - R_{lb}^s) & \text{if } w' \in [R_{lb}, MW') \\ w' + R^l(R_{ub}^s - w') & \text{if } w' \in [MW', R_{ub}) \\ w' & o/w \end{cases} \quad (8)$$

•Computing Income

$$y'_{i,h} = \sum_{i \in N_h} (g_{nw}(t'|t)nw_i + w'_i) / N_h$$

$$y''_{i,h} = \sum_{i \in N_h} (g_{nw}(t'|t)nw_i + w''_i) / N_h \quad (9)$$

Final Policy Estimates

$$WG_i = (y''_i - y'_i) \mathbf{I}(y''_i > y'_i) \quad (10)$$

$$WL_i = (y'_i - y''_i) \mathbf{I}(y''_i < y'_i) \quad (11)$$

$$BL = \sum_i WG_i - F_{sub} \sum_i WL_i; \quad BL_i = BL \times dBL \quad (12)$$

$$\overline{WG}_Q = \frac{\sum_{i \in Q} WG_i}{N_{pop}/5} \quad \overline{WL}_Q = \frac{\sum_{i \in Q} WL_i}{N_{pop}/5}$$
$$\overline{BL}_Q = \frac{\sum_{i \in Q} BL_i}{N_{pop}/5} \quad (13)$$

Reader Companion for CBO report on Min Wage (Preliminary Version. Do Not Circulate)

Fernando Hoces de la Guardia + (hopefully) a lot more people

Last edit: 2016-10-16

1 Introduction

The role of policy analysis is to connect research with policy. Because of heavy time constraints, policy analyses are typically ambiguous regarding the details of how the analysis was carried out. This creates three problems: (i) its hard to understand the connection between research and policy, (ii) allows policy makers to cherry pick policy reports, and (iii) hinders systematic improvement and/or automation of parts of the analysis. In this document we demonstrate the use of a reproducible workflow to reduce the ambiguity in policy analysis.

Here we attempt to contribute to the policy discussion of the minimum wage. The minimum wage is a contentious policy issue in the US. Increasing it has positive and negative effects that different policymakers value differently. We aim to add clarity on what those effects are, how much do we know about them, and how those effects vary when elements of the analysis change. We select the most up-to-date, non-partisan, policy analysis of the effects of raising the minimum wage, and build an open-source reproducible analysis on top of it.

In 2014 the Congressional Budget Office published the report titled "[The Effects of a Minimum-Wage Increase on Employment and Family Income](#)". The report receive wide attention from key stakeholders and has been used extensibly as an input in the debate around the minimum wage¹. To this date we consider the CBO report to be the best non-partisan estimation of the effects of raising the minimum wage at the federal level. Although there was disagreement among experts around some technical issues, this disagreement has been mainly circumscribed around one of the many inputs used in the analysis, and we can fit the opposing positions in to our framework.

Our purposes are twofold: First, promote the technical discussion around a recurrent policy issue (minimum wage) by making explicit and visible all the components and key assumptions of its most up-to-date official policy analysis. Second, demonstrate how new scientific practices of transparency and reproducibility (T & R) can be applied to policy analysis. We encourage the reader to collaborate in this document and help develop an ever-improving version of the important policy estimates² (re)produced here.

2 Employment effects

At a general level the effects on employment ($\widehat{\Delta E}$) will be calculated using a more detailed version of the following equation:

$$\widehat{\Delta E} = N \times \eta \times \% \Delta w + \text{Other factors}$$

Where N represents the relevant population, η the elasticity of labor demand, Δw the relevant percentual variation in wages, and the *Other factors* will encapsulate effects on employment through an increase in the aggregate demand.

To describe the methodology behind each of those four components we first describe the data used, the wage variable choose, and the procedure used to forecast the wage and population distribution of 2016 using data from 2013.

2.1 Data, wages, and forecast

To simulate the policy effects we need the distribution of wages and employment under the status quo. From the perspective of 2013, this implies forecasting to 2016 data on employment and wages.

2.1.1 Data

The Current Population Survey (CPS) was used to compute the effects on employment. From the analysis in the section on distributional effects we can deduce that the data corresponds to the Outgoing Rotation Group (ORG). CPS is a monthly cross sectional survey. The same individual is interviewed eight times over a period of 12 months. The interviews take place in the first and last 4 months of that period. By the 4th and 12th interview, individuals are asked detailed information on earnings. The CPS ORG file contains the information on this interviews for a given year. We analyze the data for 2013.

Currently three versions of these data sets can be found online: [CPS raw files](#), [ORG NBER](#) and [ORG CEPR](#). The analysis will be performed using the CPER ORG data base.

The weights used in our analysis will be `orgwgt/12`.

2.1.1.1 Code to load the data

```
R  
Stata
```

3.3 Computing family income under status quo and minimum wage increase

3.4 Other considerations

Results

performed using the CPER ORG data base.

The weights used in our analysis will be `orgwgt/12`

2.1.1.1 Code to load the data

```
R  
  
call.cps.org.data <- function(){  
  data_use <- "CPER_ORG"  
  
  # Using CEPR ORG data  
  if (data_use == "CPER_ORG") {  
    # Checking if working directory contains data, download if not.  
    if ( !("cepr_org_2013.dta" %in% dir()) ) {  
      # create name of file to store data  
      tf <- "cepr_org_2013.zip"  
  
      # download the CPS repwgtz zipped file to the local computer  
      download.file(url = "http://ceprdata.org/wp-content/cps/data/cepr_org_2013.zip", tf , mode  
= "wb" )  
  
      # unzip the file's contents and store the file name within the temporary directory  
      fn <- unzip( zipfile = tf , overwrite = T )  
    }  
    df <- read.dta("cepr_org_2013.dta")  
  }  
  
  # Using NBER ORG data  
  if (data_use == "NBER_ORG") {  
    # Checking if working directory contains data, download if not.  
    if ( !("morg13.dta" %in% dir()) ) {  
      # Downloading data 53mb  
      df <- read.dta("http://www.nber.org/morg/annual/morg13.dta")  
    }  
    df <- read.dta("morg13.dta")  
  }  
}
```

2.5 Computing effects on employment

Putting all elements together we get:

$$\widehat{\Delta E} = \sum_{g \in \{A, T\}} \left(\widehat{N}_g^{final} \times \widehat{\eta}_{w \leq MW}^g \times \widehat{\% \Delta w^g} \right) - \widehat{OF}$$

2.5.1 Code to compute each component

R

Stata

Components of Elasticities

	Adult	Teen
η_{lit}	-0.03	-0.10
$\eta_{w \leq MW'}$	-0.23	-0.13
F_{adj}	4.50	4.50
$\% \Delta w$	13.81	16.65
$\widehat{\eta}_{w \leq MW}$	-0.15	-0.45

Using all the components described above we get $\widehat{\Delta^- E} = -478$ thousand jobs. The report however computes F_{adj}^g in a different fashion and gets a value of 4.5 (when computing the values of F_{adj}^g from the table below - as oppose to using historical values - we get $\widehat{\Delta^- E} = -321$ thousand jobs).

3 Distributional effects

In the first step towards obtaining the policy estimates presented in the [introduction](#) we concluded with

Equations; Back	

Comparing the Trade-offs: A Toy Example

Model for the normative comparison made by a policy maker (welfare function):

$$W(\rho) = \sum_{i \in N} (\omega_{wg} wg_i + \omega_{wl} wl_i + \omega_{bl} bl_i) \omega_i^d(Q_i, \rho)$$

with:

$$\omega_i^d(Q_i, \rho) = \frac{(1 - \rho(Q_i - Q_{median}))}{\sum_i \omega_i^d(Q_i)} Q_{max} \quad \text{for } \rho \in \left(-\frac{1}{2}, \frac{1}{2}\right)$$

$\rho > 0$ represents positive valuation of progressive redistribution. $\rho < 0$ represents positive valuation of regressive redistribution.

Redistributional Preferences

Toy - minimum wage

Motivation 2: An Academic Concern in 2013

“I worry that someday sooner or later the existing social contract to take CBO scores at face value will break down. Conventional Certitudes that lack foundation cannot last indefinitely.”

— Charles Manski
Public Policy in an Uncertain World, 2013

Motivation 2: A Reality In 2017

Former CBO Directors Defend Agency Against Republican Attacks

White House has questioned analyses of health-care bills; 'It's over the line,' says Douglas Holtz-Eakin

Challenges And Suggestions

Challenges:

- Policymakers may not want analyses to be open.
- Analysts may wish to keep policy analyses “closed”.
- For policy analysis contracted out to third parties: Opening methods will prevent them from reselling extensions.
- Initially reproducibility represents an additional layer of work.
- Limits to sharing sensitivity of information, requires resources for adequate de-identification if open data is expected
